Activist paper preliminary output

Anya Nakhmurina

27 October, 2016

The purpose of this document

The research question of this paper is to learn whether there are any network effects among the 'active' and 'passive' activist investors over the span of the activists' campaign. This document contains a summary of my progress with this project. Research approach section is basically copied from my original proposal to remind the reader about my research approach.

Table 1: Summary of events by hedge fund stated goals - the whole 2015. The sample consists of 467 activist campaigns in 2015, of which 352 contain demands.

Activist' Objective	Num. of events	% of Sample	% of Success
General undervaluation/maximize shareholder value	115	24.6%	NA
Excess cash, under-leverage, dividends/repurchases	28	6%	71.4%
Equity issuance, restructure debt, recapitalization	16	3.43%	50%
Operational efficiency	24	5.14%	45.8%
Lack of focus, business restructuring and spinning off	9	1.93%	66.7%
M&A: as target (against the deal/for better terms)	19	4.07%	31.6%
M&A: as acquirer (against the deal/for better terms)	4	0.857%	100%
Pursue growth strategies	8	1.71%	50%
Sell company or main assets to a third party	37	7.92%	56.8%
Take control/buyout company and/or take it private	32	6.85%	40.6%
Rescind takeover defenses	15	3.21%	53.3%
Oust CEO, chairman	11	2.36%	63.6%
Board independence and fair representation	178	38.1%	64.6%
More information disclosure/potential fraud	25	5.35%	12%
Excess executive compensation/pay for performance	25	5.35%	40%
Institute environmental protection policy	14	3%	0%
Public Short Position/Bear Raid	2	0.428%	0%
Sum of categories not falling into general undervaluation	352	75.4%	57.7%

Table 2: Summary of events by hedge fund stated goals - the merged subsample of 2015. The sample consists of 104 activist campaigns in 2015, of which 104 contain demands. The campaigns that fall into general undervaluation category are not considered here.

Activist' Objective	Num. of events	% of Sample	% of Success
General undervaluation/maximize shareholder value	0	0%	NA
Excess cash, under-leverage, dividends/repurchases	66	18.2%	0%
Equity issuance, restructure debt, recapitalization	23	6.35%	0%
Operational efficiency	36	9.94%	0%
Lack of focus, business restructuring and spinning off	53	14.6%	0%
M&A: as target (against the deal/for better terms)	34	9.39%	0%
M&A: as acquirer (against the deal/for better terms)	13	3.59%	0%
Pursue growth strategies	5	1.38%	0%
Sell company or main assets to a third party	87	24%	0%
Take control/buyout company and/or take it private	11	3.04%	0%
Rescind takeover defenses	23	6.35%	0%
Oust CEO, chairman	35	9.67%	0%
Board independence and fair representation	99	27.3%	0%
More information disclosure/potential fraud	23	6.35%	0%
Excess executive compensation/pay for performance	37	10.2%	0%
Institute environmental protection policy	3	0.829%	0%
Public Short Position/Bear Raid	0	0%	NaN%
Sum of categories not falling into general undervaluation	362	100%	66.9%

Table 3: Sussess rate by stage - the whole 2015. This table provides the breakdown of stages at which the campaign is terminated. The table is based on the sample of all campaigns that took place in 2015. The data on campaign availability comes from SharkWatch database. Campaigns were manually classified.

Exit after	Num. of campaigns	% of Sample	Number of Successes	% of Successes
Demand negotiations	336	29.7%	214	63.7%
Board representation	433	38.3%	228	52.7%
Proxy fight	362	32%	247	68.2%

Table 4: Sussess rate by stage - the merged subsample. This table provides the breakdown of stages at which the campaign is terminated. The table is based on the observations that are left after the campaigns data is merged with 13F data. The data on campaign availability comes from SharkWatch database. Campaigns were manually classified.

Exit after	Num. of campaigns	% of Sample	Number of Successes	% of Successes
Demand negotiations	163	45%	108	66.3%
Board representation	38	10.5%	14	36.8%
Proxy fight	161	44.5%	120	74.5%

Table 5: Descriptive statistics. This table provides summary statistics on the variables used in preliminary analysis. The variables are grouped by type. won_brep_percent is the percentage of board seats won out of the number of activists' nominees. won_brep_dummy is an indicator variable equal to 1 when at least 1 activist nominee was elected to the board. success_of_stated_obj is an indicator of fulfillment of activists' demands. sales growth is the growth of sales over the span of the campaign. open profit growth is an operational profitability growth over the span of the campaign. Operational profitability is defined as in Ball et. al (2016). active activist size correponds to the total assets of an activist group, computed from 13F filings. investor.number is a total number of institutional investors that hold shares of a company. total.activist.number is the number of passive activist investors that hold shares of the company. Activist investor is defined as any investor that appeared in SharkWatch database at least once. activist.size.vweqhted is the sum of all the company's activists' assets weighted by the share of investments in the company. activist.size.average is an average of total assets of company's activists. spring measure corresponds to the edges of Spring Network, which is described above. number of connections corresponds to Number of Connections Network, where the weight of the edge is number of connections between two activists. size is the market value of the company. age is the age of the company. leverage is the leverage of the company. mtb is the market-to-book ratio of the company. oper_profit is an operating profitability of the company. roa is return on company's assets. tobins q is the company's Tobin's Q. asset turnover is the company's asset turnover. rd_to_assets is a share of R&D expenditures to the company's assets. revtq is the quartely revenue, and *saleq* are the company's sales.

Notes: OLS regression of the equation $Y = \alpha + \beta x + \gamma \bar{x} + controls + \epsilon$. sales_growth is the growth of sales over the span of the campaign. oper_profit_growth is an operational profitability growth over the span of the campaign. Operational profitability is defined as in Ball et. al (2016). active.activist.size correponds to the total assets of an activist group, computed from 13F filings. extitactive.activist.size correponds to the total assets of an activist group, computed from 13F filings. activist.size.vweghted is the sum of all the company's activists' assets weighted by the share of investments in the company. Activist investor is defined as any investor that appeared in SharkWatch database at least once. size is the market value of the company. age is the age of the company. leverage is the leverage of the company. Robust standard errors in parenthesis.

of institutional investors that hold shares of a company. total activist number is the number of passive activist investors that hold shares of the company. Activist investor is Table 12: Correlation table. won_brep_dummy is an indicator variable equal to 1 when at least 1 activist nominee was elected to the board.success_of_stated_obj is an defined as any investor that appeared in SharkWatch database at least once. activists.size.vweghted is the sum of all the company's activists' assets weighted by the share of investments in the company. activist.size.average is an average of total assets of company's activists. size is the market value of the company. age is the age of the company. leverage is the leverage of the company. mtb is the market-to-book ratio of the company. oper_profit is an operating profitability of the company. All the other variables are centrality measures of activist network. Centrality captures the importance of the node position in a network. Three centrality measures are used. Closeness centrality shows indicator of fulfillment of activists' demands. active activist, size correponds to the total assets of an activist group, computed from 13F filings. investor number is a total number how close each node to any other node. Betweennes centrality captures how well situated a node is in terms of the paths that it lies on. Degree centrality, is defined a the number of links incident to a node. Bonacich centrality is a degree centrality adjusted for the centrality of the neighbours in a network. The centrality measures were computed for both Simple and Spring networks. (By construction, centrality measures for Simple network are identical to the centrality measures of Number of Connections network.) I aggregated the centrality measures for each campaign. That is, act_simple_closeness is a sum of closeness centralities of every active activist participating in a campaign, and simple_closeness is a sum of closeness centralities of every passive activist that invested in the company but does not participate in a campaign.
